Cambridge, December 2018

# Definition (Finite Poincaré complex)

A (connected) finite *n*-dimensional *CW*-complex *X* is a finite *n*-dimensional Poincaré complex if there is  $[X] \in H_n(X; \mathbb{Z}^w)$  such that the induced  $\mathbb{Z}\pi$ -chain map

$$-\cap [X]\colon C^{n-*}(\widetilde{X}) o C_*(\widetilde{X})$$

is a  $\mathbb{Z}\pi$ -chain homotopy equivalence.

## Theorem (Closed manifolds are Poincaré complexes)

A closed n-dimensional manifold M is a finite n-dimensional Poincaré complex with  $w = w_1(X)$ .

# Definition (Finite Poincaré complex)

A (connected) finite *n*-dimensional *CW*-complex *X* is a finite *n*-dimensional Poincaré complex if there is  $[X] \in H_n(X; \mathbb{Z}^w)$  such that the induced  $\mathbb{Z}\pi$ -chain map

$$-\cap [X]\colon C^{n-*}(\widetilde{X}) o C_*(\widetilde{X})$$

is a  $\mathbb{Z}\pi$ -chain homotopy equivalence.

#### Theorem (Closed manifolds are Poincaré complexes)

A closed n-dimensional manifold M is a finite n-dimensional Poincaré complex with  $w = w_1(X)$ .

# Definition (Poincaré duality group)

A Poincaré duality group *G* of dimension *n* is a finitely presented group satisfying:

• G is of type FP.

• 
$$H^i(G; \mathbb{Z}G) \cong \begin{cases} 0 & i \neq n; \\ \mathbb{Z} & i = n. \end{cases}$$

## Theorem (Wall)

If G is a d-dimensional Poincaré duality group for  $d \ge 3$  and  $\widetilde{K}_0(\mathbb{Z}G) = 0$ , then there is a model for BG which is a finite Poincaré complex of dimension d.

# Definition (Poincaré duality group)

A Poincaré duality group *G* of dimension *n* is a finitely presented group satisfying:

• G is of type FP.

• 
$$H^i(G; \mathbb{Z}G) \cong \begin{cases} 0 & i \neq n; \\ \mathbb{Z} & i = n. \end{cases}$$

## Theorem (Wall)

If G is a d-dimensional Poincaré duality group for  $d \ge 3$  and  $\widetilde{K}_0(\mathbb{Z}G) = 0$ , then there is a model for BG which is a finite Poincaré complex of dimension d.

# Corollary

If M is a closed aspherical manifold of dimension d, then  $\pi_1(X)$  is a d-dimensional Poincaré duality group.

## Theorem (Eckmann-Müller, Linnell)

Every 2-dimensional Poincaré duality group is the fundamental group of a closed surface.

# Corollary

If M is a closed aspherical manifold of dimension d, then  $\pi_1(X)$  is a d-dimensional Poincaré duality group.

# Theorem (Eckmann-Müller, Linnell)

Every 2-dimensional Poincaré duality group is the fundamental group of a closed surface.

. . . . . . .

A .

# Hyperbolic groups

# Definition (hyperbolic group)

A hyperbolic group G is a finitely generated group such that for one (and hence all) choice of symmetric finite set of generators the Cayley graph with the associated word metric is a hyperbolic geodesic metric space.

- A geodesic metric space is called hyperbolic if geodesic triangles are thin in comparison with geodesic triangles in  $\mathbb{R}^2$ .
- The property hyperbolic is a quasi-isometry invariant.
- Every hyperbolic group is finitely presented and has a finite model for its classifying space of proper actions.

• Every torsionfree hyperbolic group has a finite model for BG.

# Definition (hyperbolic group)

A hyperbolic group G is a finitely generated group such that for one (and hence all) choice of symmetric finite set of generators the Cayley graph with the associated word metric is a hyperbolic geodesic metric space.

- A geodesic metric space is called hyperbolic if geodesic triangles are thin in comparison with geodesic triangles in  $\mathbb{R}^2$ .
- The property hyperbolic is a quasi-isometry invariant.
- Every hyperbolic group is finitely presented and has a finite model for its classifying space of proper actions.

• Every torsionfree hyperbolic group has a finite model for *BG*.

# Definition (hyperbolic group)

A hyperbolic group G is a finitely generated group such that for one (and hence all) choice of symmetric finite set of generators the Cayley graph with the associated word metric is a hyperbolic geodesic metric space.

- A geodesic metric space is called hyperbolic if geodesic triangles are thin in comparison with geodesic triangles in  $\mathbb{R}^2$ .
- The property hyperbolic is a quasi-isometry invariant.
- Every hyperbolic group is finitely presented and has a finite model for its classifying space of proper actions.
- Every torsionfree hyperbolic group has a finite model for BG.

- A random finitely presented group is hyperbolic.
- One can assign to hyperbolic group a topological space called boundary ∂G such that for any geodesic hyperbolic metric space X on which G acts properly and cocompactly by isometries there is a compactification X = X II ∂G such that ∂G is a Z-set in X. This applies in particular to the Cayley graph.
- Notice that  $\partial G$  is independent of X.
- In general ∂G is totally disconnected, in other words, looks like a Cantor set.

## Theorem (Hadamard)

If *M* is a closed smooth Riemannian manifold of dimension *n*, whose section curvature is negative, then  $\pi = \pi_1(M)$  is a torsionfree hyperbolic group with  $\partial \pi = S^{n-1}$ .

- Actually M is a geodesic metric space on which  $\pi$  acts freely, properly and cocompactly by isometries.
- There is a diffeomorphism  $\widetilde{M} \xrightarrow{\cong} \mathbb{R}^n$  and  $\partial \pi$  is the sphere  $S^{n-1}$  at infinity.

Wolfgang Lück (Bonn)

# Conjecture (Gromov)

Let G be a torsionfree hyperbolic group whose boundary is a sphere  $S^{n-1}$ . Then there is a closed aspherical manifold M with  $\pi_1(M) \cong G$ .

# Theorem (Bartels-Lück-Weinberger)

Gromov's Conjecture is true for  $n \ge 6$ .

# Conjecture (Wall)

Every Poincaré duality group is the fundamental group of an aspherical closed manifold.

# Conjecture (Cannon's Conjecture in the torsionfree case)

A torsionfree hyperbolic group G has  $S^2$  as boundary if and only if it is the fundamental group of a closed hyperbolic 3-manifold.

Wolfgang Lück (Bonn)

Theorem (Cannon-Cooper, Eskin-Fisher-Whyte, Kapovich-Leeb)

A Poincaré duality group G of dimension 3 is the fundamental group of an aspherical closed 3-manifold if and only if it is quasi-isometric to the fundamental group of an aspherical closed 3-manifold.

A closed 3-manifold is a Seifert manifold if it admits a finite covering M→ M such that there exists a S<sup>1</sup>-principal bundle S<sup>1</sup> → M→ S for some closed orientable surface S.

#### Theorem (Bowditch)

If a Poincaré duality group of dimension 3 contains an infinite normal cyclic subgroup, then it is the fundamental group of a closed Seifert 3-manifold.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Theorem (Cannon-Cooper, Eskin-Fisher-Whyte, Kapovich-Leeb)

• In order to prove the Cannon Conjecture, it suffices to show for a hyperbolic group *G*, whose boundary is *S*<sup>2</sup>, that it is quasiisometric to the fundamental group of some aspherical closed 3-manifold.

#### Theorem

Let G be the fundamental group of an aspherical oriented closed 3-manifold. Then G satisfies:

- G is residually finite and Hopfian;
- All its  $L^2$ -Betti numbers  $b_n^{(2)}(G)$  vanish;
- Its deficiency is 0. In particular it possesses a presentation with the same number of generators and relations;
- Suppose that M is hyperbolic. Then G is virtually compact special and linear over Z. It contains a subgroup of finite index G' which can be written as an extension 1 → π<sub>1</sub>(S) → G → Z → 1 for some closed orientable surface S.
- Recall that any finitely presented groups occurs as the fundamental group of a closed *d*-dimensional smooth manifold for every *d* ≥ 4.

#### Theorem

Let G be the fundamental group of an aspherical oriented closed 3-manifold. Then G satisfies:

- G is residually finite and Hopfian;
- All its  $L^2$ -Betti numbers  $b_n^{(2)}(G)$  vanish;
- Its deficiency is 0. In particular it possesses a presentation with the same number of generators and relations;
- Suppose that M is hyperbolic. Then G is virtually compact special and linear over Z. It contains a subgroup of finite index G' which can be written as an extension 1 → π<sub>1</sub>(S) → G → Z → 1 for some closed orientable surface S.
- Recall that any finitely presented groups occurs as the fundamental group of a closed *d*-dimensional smooth manifold for every *d* ≥ 4.

Theorem (Ferry-Lück-Weinberger, (preprint, 2018), Stable Cannon Conjecture)

Let G be a hyperbolic 3-dimensional Poincaré duality group. Let N be any smooth, PL or topological manifold respectively which is closed and whose dimension is  $\geq 2$ .

Then there is a closed smooth, PL or topological manifold M and a normal map of degree one

such that the map f is a simple homotopy equivalence.

# Theorem (Stable Cannon Conjecture, continued)

Moreover:

Let  $\widehat{M} \to M$  be the *G*-covering associated to the composite of the isomorphism  $\pi_1(f) \colon \pi_1(M) \xrightarrow{\cong} G \times \pi_1(N)$  with the projection  $G \times \pi_1(N) \to G$ . Suppose additionally that N is aspherical and dim $(N) \ge 3$ .

Then  $\widehat{M}$  is homeomorphic to  $\mathbb{R}^3 \times N$ . Moreover, there is a compact topological manifold  $\overline{\widehat{M}}$  whose interior is homeomorphic to  $\widehat{M}$  and for which there exists a homeomorphism of pairs

$$(\overline{\widehat{M}},\partial\overline{\widehat{M}}) \to (D^3 \times N, S^2 \times N).$$

. . . . . . .

### Proof.

- Stable vector bundles over X are classified by the first and second Stiefel-Whitney class w<sub>1</sub>(ξ) and w<sub>2</sub>(ξ) in H<sup>\*</sup>(X; Z/2).
- Let  $\xi$  be a *k*-dimensional vector bundle over *X* such that  $w_1(\xi) = w_1(X)$  and  $w_2(\xi) = w_1(\xi) \cup w_1(\xi)$  holds.
- A spectral sequence argument applied to  $\Omega_3(X, w_1(X))$  shows that there is a closed 3-manifold *M* together with a map  $f: M \to X$  of degree one such that  $f^*w_1(X) = w_1(M)$ .
- Then  $w_1(f^*\xi) = w_1(M)$  and the Wu formula implies  $w_2(M) = w_1(f^*\xi) \cup w_1(f^*\xi)$ .
- Hence f<sup>\*</sup>ξ is stably isomorphic to the stable tangent bundle of M and we get the desired normal map.

# The total surgery obstruction

- Consider an aspherical finite *n*-dimensional Poincaré complex *X* such that  $G = \pi_1(X)$  is a Farrell-Jones group, i.e., satisfies both the *K*-theoretic and the *L*-theoretic Farrell-Jones Conjecture with coefficients in additive categories, and  $\mathcal{N}(X)$  is non-empty. (For simplicity we assume  $w_1(X) = 0$  in the sequel.)
- We have to find one normal map of degree one

whose simple surgery obstruction  $\sigma^{s}(f, \overline{f}) \in L_{3}^{s}(\mathbb{Z}G)$  vanishes.

## The total surgery obstruction

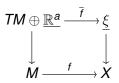

- Consider an aspherical finite *n*-dimensional Poincaré complex X such that  $G = \pi_1(X)$  is a Farrell-Jones group, i.e., satisfies both the K-theoretic and the L-theoretic Farrell-Jones Conjecture with coefficients in additive categories, and  $\mathcal{N}(X)$  is non-empty. (For simplicity we assume  $w_1(X) = 0$  in the sequel.)
- We have to find one normal map of degree one

whose simple surgery obstruction  $\sigma^{s}(f, \overline{f}) \in L_{3}^{s}(\mathbb{Z}G)$  vanishes.

# The total surgery obstruction

- Consider an aspherical finite *n*-dimensional Poincaré complex X such that  $G = \pi_1(X)$  is a Farrell-Jones group, i.e., satisfies both the K-theoretic and the L-theoretic Farrell-Jones Conjecture with coefficients in additive categories, and  $\mathcal{N}(X)$  is non-empty. (For simplicity we assume  $w_1(X) = 0$  in the sequel.)
- We have to find one normal map of degree one

whose simple surgery obstruction  $\sigma^{s}(f, \overline{f}) \in L_{3}^{s}(\mathbb{Z}G)$  vanishes.

• Recall that the simple surgery obstruction defines a map

$$\sigma^{s} \colon \mathcal{N}(X) \to L_{n}^{s}(\mathbb{Z}G).$$

- Fix a normal map  $(f_0, \overline{f_0})$ .
- Then there is a commutative diagram

$$\mathcal{N}(X) \xrightarrow{\sigma^{s}(-,-)-\sigma^{s}(f_{0},\overline{f_{0}})} L_{n}^{s}(\mathbb{Z}G)$$

$$s_{0} \downarrow \cong \qquad \cong \uparrow \operatorname{asmb}_{n}^{s}(X)$$

$$\mathcal{H}_{n}(X; \mathbf{L}_{\mathbb{Z}}^{s}\langle 1 \rangle) \xrightarrow{H_{n}^{G}(\operatorname{id}_{X}; \mathbf{i})} \mathcal{H}_{n}(X; \mathbf{L}_{\mathbb{Z}}^{s})$$

whose vertical arrows are bijections thanks to the Farrell-Jones Conjecture and the upper arrow sends the class of  $(f, \overline{f})$  to the difference  $\sigma^{s}(f, \overline{f}) - \sigma^{s}(f, \overline{f_{0}})$  of simple surgery obstructions.

An easy spectral sequence argument yields a short exact sequence

$$0 \to H_n(X; \mathbf{L}^{\mathbf{s}}_{\mathbb{Z}}\langle 1 \rangle) \xrightarrow{H_n(\operatorname{id}_X; \mathbf{i})} H_n(X; \mathbf{L}^{\mathbf{s}}_{\mathbb{Z}}) \xrightarrow{\lambda_n^{\mathbf{s}}(X)} L_0(\mathbb{Z}).$$

Consider the composite

$$\mu_n^s(X)\colon \mathcal{N}(X) \xrightarrow{\sigma^s} L_n^s(\mathbb{Z}G, w) \xrightarrow{\operatorname{asmb}_n^s(X)^{-1}} H_n(X; \mathbf{L}_{\mathbb{Z}}^s) \xrightarrow{\lambda_n^s(X)} L_0(\mathbb{Z}).$$

э

- There exists a normal map of degree one (f, f) with target X and vanishing simple surgery obstruction σ<sup>s</sup>(f, f) ∈ L<sup>s</sup><sub>n</sub>(ℤG) if and only if s(X) ∈ L<sub>0</sub>(ℤ) ≃ ℤ vanishes.
- The total surgery obstruction is a homotopy invariant of X and hence depends only on G.

### Definition (Homology ANR-manifold)

- A homology ANR-manifold X is an ANR satisfying:
  - X has a countable basis for its topology;
  - The topological dimension of X is finite;
  - X is locally compact;
  - for every  $x \in X$  we have for the singular homology

$$H_i(X, X - \{x\}; \mathbb{Z}) \cong \begin{cases} 0 & i \neq n; \\ \mathbb{Z} & i = n. \end{cases}$$

If X is additionally compact, it is called a closed ANR-homology manifold.

## Definition (Homology ANR-manifold)

A homology ANR-manifold X is an ANR satisfying:

- X has a countable basis for its topology;
- The topological dimension of X is finite;
- X is locally compact;
- for every  $x \in X$  we have for the singular homology

$$H_i(X, X - \{x\}; \mathbb{Z}) \cong egin{cases} 0 & i 
eq n; \ \mathbb{Z} & i = n. \end{cases}$$

If X is additionally compact, it is called a closed ANR-homology manifold.

- Every closed topological manifold is a closed ANR-homology manifold.
- Let *M* be homology sphere with non-trivial fundamental group. Then its suspension  $\Sigma M$  is a closed ANR-homology manifold but not a topological manifold.

A .

### Theorem (Quinn (1987))

There is an invariant  $\iota(M) \in 1 + 8\mathbb{Z}$  for homology ANR-manifolds with the following properties:

• if  $U \subset M$  is an open subset, then  $\iota(U) = \iota(M)$ ;

•  $i(M \times N) = i(M) \cdot i(N);$ 

- Let M be a homology ANR-manifold of dimension ≥ 5. Then M is a topological manifold if and only if ι(M) = 1.
- The Quinn obstruction and the total surgery obstruction are related for an aspherical closed ANR-homology manifold M of dimension ≥ 5 by

$$\iota(M) = 8 \cdot s(X) + 1.$$

## Theorem (Quinn (1987))

There is an invariant  $\iota(M) \in 1 + 8\mathbb{Z}$  for homology ANR-manifolds with the following properties:

- if  $U \subset M$  is an open subset, then  $\iota(U) = \iota(M)$ ;
- $i(M \times N) = i(M) \cdot i(N);$
- Let M be a homology ANR-manifold of dimension ≥ 5. Then M is a topological manifold if and only if ι(M) = 1.
- The Quinn obstruction and the total surgery obstruction are related for an aspherical closed ANR-homology manifold M of dimension ≥ 5 by

$$\iota(M)=8\cdot s(X)+1.$$

# Proof of the Theorem about the vanishing of the surgery obstruction

### Proof.

- We have to show for the aspherical finite 3-dimensional Poincaré complex *X* that its total surgery obstruction vanishes.
- The total surgery obstruction satisfies a product formula

$$8 \cdot s(X \times Y) + 1 = (8 \cdot s(X) + 1) \cdot (8 \cdot s(y) + 1).$$

This implies

$$s(X \times T^3) = s(X).$$

• Hence it suffices to show that  $s(X \times T^3)$  vanishes.

# Proof of the Theorem about the vanishing of the surgery obstruction

### Proof.

- We have to show for the aspherical finite 3-dimensional Poincaré complex *X* that its total surgery obstruction vanishes.
- The total surgery obstruction satisfies a product formula

$$8 \cdot s(X \times Y) + 1 = (8 \cdot s(X) + 1) \cdot (8 \cdot s(y) + 1).$$

This implies

$$s(X \times T^3) = s(X).$$

• Hence it suffices to show that  $s(X \times T^3)$  vanishes.

26/31

### Proof (continued).

- There exists an aspherical closed ANR-homology manifold *M* and a homotopy equivalence  $f: M \to X \times T^3$ .
- There is a *Z*-compactification  $\overline{\widetilde{X}}$  of  $\widetilde{X}$  by the boundary  $\partial G = S^2$ .
- One constructs an appropriate Z-compactification *M* of *M* so that we get a ANR-homology manifold *M* whose boundary is a topological manifold and whose interior is *M*.
- By adding a collar to *M* one obtains a ANR-homology manifold *Y* which contains *M* as an open subset and contains an open subset *U* which is homeomorphic to R<sup>6</sup>.

< □ > < □ > < □ > < □ >

### Proof (continued).

Hence we get

$$8s(X \times T^3) + 1 = 8s(M) + 1 = i(M) = i(\widetilde{M})$$
  
=  $i(Y) = i(U) = i(\mathbb{R}^6) = 1.$ 

• This implies  $s(X \times T^3) = 0$  and hence s(X) = 0.

Wolfgang Lück (Bonn)

3

### Notation

Let  $(\overline{Y}, Y)$  be a topological pair. Put  $\partial Y := \overline{Y} \setminus Y$ . Let X be a topological space and  $f : X \to Y$  be a continuous map. Pulling back the boundary is a construction of a topological pair  $(\overline{X}, X)$  and a continuous map  $\overline{f} : \overline{X} \to X$ 

- It has the desired universal universal property which we will not state here.
- Its basic properties are:
